

5 SENSES FOR INVESTIGATING NATURE

SIGHT

We use our eyes to see nature around us

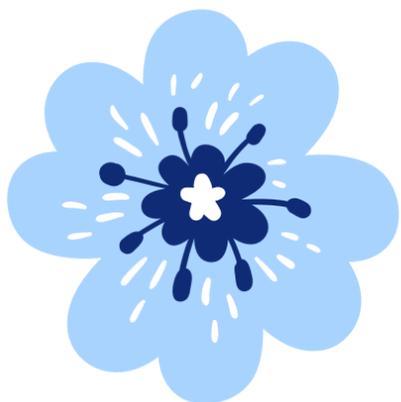

Nature is full of things to observe. As humans, we use sight as our primary sense to discover the natural world around us. Birds, insects, mammals and plants can all be detected by using our sight.

HEARING

We use our ears to listen to sounds

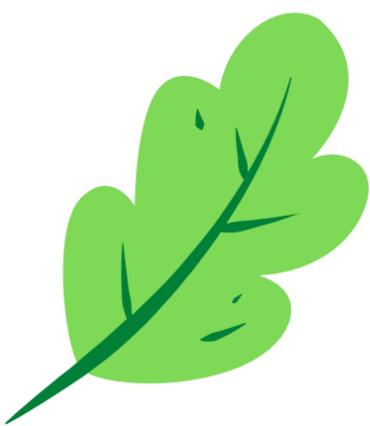

Nature is the best musician. Whether we are listening to bird calls, raindrops in puddles, wind rustling the trees or insects buzzing, by using only our hearing, we know nature is all around us.

SMELL

We use our nose to smell scents in the air

Smells help give us clues to what surrounds us. It is possible to discover a blooming flower, a disturbed stink bug, or even leaves decomposing on the forest floor just by using our noses.

TOUCH

We use our skin to feel textures in nature

Feeling leaf textures, rough bark, a smooth river stone and even the breeze on our cheeks help us to connect with nature around us. Investigating nature through touch is a fun way to learn!

TASTE

We use our tongues to taste food

There are some things in nature that we can even try tasting! When you bite into a sweet strawberry or tasty mint leaf, remember all our food comes from nature.

WHAT SENSES DO YOU LIKE TO USE TO EXPLORE NATURE?
